construction from both expressional and functional perspectives this work proposes and explores an alternative paradigm for pattern cutting that includes a new theoretical approximation of the body as well as a more kinetic method for garment construction that unlike the prevalent theory and its related methods takes as its point of origin the interaction between the anisotropic fabric and the biomechanical structure of the body as such the research conducted here is basic research aiming to identify fundamental principles for garment construction based on some key principles found in the works of geneviève sevin doering and in pre tailoring methods for constructing garments the proposed theory for and method of garment construction was developed through concrete experiments by cutting and draping fabrics on live models instead of a static matrix of a non moving body the result is a kinetic construction theory of the body that is comprised of balance directions and key biomechanical points along with an alternative draping method for dressmaking this methodology challenges the fundamental relationship between dress garment construction and the body working from the body outward as opposed to the methods that are based on the prevalent paradigm of the tailoring matrix which work from the outside toward the body this alternative theory for understanding the body and the proposed method of working allows for diverse expressions and enhanced functional possibilities in dress
